

## Can You Secure Data While Enabling Remote Access and Collaboration?

Cyberattacks will cost hospitals more than \$305 billion over the next five years and one in 13 patients will have their social security or financial record stolen [Accenture].

Someone is trying to access your data, even as you read this. In today's digital world, the persistent threat of cyberattacks is the greatest enemy to a healthcare provider's ability to service their clients. As a result, management is often faced with an "either/or" decision: give their staff the collaboration tools they need to be productive or keep their data secure from hackers and other cyber-criminals.

### Modern Threats Cost Your Business

- Average small business pays up to \$1 Mil after a cyber-attack [Ponemon Institute]
- 60% of companies will go out of business in less than 6-months following a cyber-attack [U.S. National Cyber Security Alliance]

### ProStratus Difference:

- Secure, fast access to your data from any location with any device
- Maintain compliance with full security controls over all your data
- Minimize training with mapped drives and other familiar interfaces
- Maximize data protection
- Prevent Ransomware

### Data: Your Digital Currency

But your business operates on client data and the confidential information you accumulate and share back and forth with your customers. That data acts as a type of "digital currency" touching every aspect of your business including the ability to move and share large imaging files such as an MRI scan or X-Ray. While you do your best to protect that data, if your patients protected health information (PHI) is uploaded and shared, it can be exposed to a host of modern threats that seek to penetrate your database and immobilize operations. It can also put you out of compliance with the regulations meant to protect your patient's data.

## Who Else Has Access to Your Data?

Productivity tools such as Google Drive and Dropbox take productivity to an entirely new level. Your patient records, test results and other files can be shared, transmitted, uploaded and stored with just the click of a button. Sharing of data and files is greater than ever before and your internal team expects these tools to be available and patients expect their information to remain safe.

**But there are modern threats that seek to intercept your data.** Real and imminent threats lurk behind the veil of productivity. Every time a file is transmitted onto a third party cloud or opened on a mobile device, your data is exposed. Modern threats such as ransomware can hold your data ransom in exchange for dollars. Data theft from a disgruntled employee or targeted social engineering designed to bait and trick employees into accidentally clicking on an infected link can quickly give criminals access to your data.

## *ProStratus* gives you the controls to:

- Detect Ransomware, Wipe Remote Files and Restrict Access when needed
- Track file changes and audit user activity so you are never caught off-guard
- Provide policy-based governance of access and collaboration
- Integrate your antivirus software for deeper security
- Maintain your data on-premise to maintain compliance and regulatory controls

The fact is that tools like Antivirus and Backup do a great job of protecting against certain threats, but data governance is often overlooked or sacrificed for productivity needs. File sharing tools like Dropbox generally increase the exposure of your data as it is exposed to third party clouds, and internal safeguards that make it vulnerable to modern threats. These types of threats target the everyday transactions of your organizations forcing many businesses to make a choice between security or productivity

**But you shouldn't have to choose.**

## *ProStratus* Combines Productivity & Data Governance

Thankfully, you don't have to choose between productivity and security. *ProStratus* combines the productivity that is expected from file sync and share tools like Dropbox with features that are focused on data governance.

**With *ProStratus*, you can now:**

Reduce Cost

Enhance Security

Maximize Productivity
